DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 1 and 11 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Moshfeghi (US 5,633,951).

Regarding claim 1, Moshfeghi teaches, limitation of claim 1, a method for registering images (Column 4, Lines 57-59), comprising the steps of: receiving a first image and a second image, said first image and said second image including data sets of at least two dimensions (Column 4, Lines 57-59, wherein the volumetric images are generated from two or three dimensional imaging which includes at least 2D image data as discussed in Column 4, Lines 15-19); globally transforming one of said images via a rigid transformation technique (Column 7, Lines 51-58, wherein the step of the goal surface image to warp into registration with the start surface image, is the global transforming of one of the images); locally transforming one of said images via an

iterative motion tracking technique (Column 11, Lines 23-31, wherein the elastic deformation step is *the* local transforming action being performed on the volume 2 image after the image has gone through warping action as discussed above, and the elastic deformation action is being performed based on motion tracking since elastically transforming the entire volume image 2 using local deformations determined as a function of *local displacements of points* on the warped surface as discussed in Column 2, Lines 51-54 wherein local displacement function is *the* motion tracking since displacement is a motion component and the action it is iterative as discussed in Column 11, Lines 36-40); and outputting a registered image (Column 4, Line 62 through Column 5, Line 2, where combined image of volume 1 and volume 2 is output to the display 18).

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Moshfeghi.

Regarding claim 11, while Moshfeghi shows the flow chart of the functional steps of the programming claim 11, Moshfeghi fails to specifically teach programming codes for performing the function of the claim however, it would have been obvious to an ordinary practitioner in the art to generate the corresponding computer codes in view of

Art Unit: 2621

the flow chart of figure 2 for performing the computer codes including items 38 for receiving of images and global transforming, Item 42 for local transforming, and item 44 for outputting the registered final image.

Allowable Subject Matter

6. Claims 2-10 and 12-20 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the *base* claim and any *intervening* claims. The following is a statement of reasons for the indication of allowable subject matter: the prior art of record specifically Moshfeghi does not teach global transforming steps of claims 2 and 12, transformation weighting process on each point in at least one of the images that is not a feature point that is being tracked of claims 10 and 20, combine with other features and elements of the claims.
